Catechin's introduction

- catechin
- Polyhydroxy flavan-3 –general of phenol , but sometimes unspecified (+) catechin. Widely distributed in the plant kingdom, and large presence in Acacia catechu and gambir's skin together with tannins. Tannins very weak, but easy to overlap, such as heat through the formation of tannin and acid。 2. Because of containing three carbon atoms and having uneven diastereomers.

Catechin's introduction

- Catechins are one of polyphenolic (Polyphenol), because there is a bitter taste, the impact on the taste of tea is quite big! Tea catechins can be divided into three types of free patterns (Catechin C, Epicatechin EC & Epigallocatechin, EGC) , and two sub-esterified gallic acid (Epicatechin gallate, ECG & Epigallocatechin gallate,EGCG) , and later (ECG&EGCG) 's content is more。 Currently other countries has been isolated catechins out from various tea and purified, put into use in different ways.
